Foundations for Inference in Probabilistic Relational Models

Paulius Dilkas

27th May 2020

Outline

Probabilistic Relational Models

Markov Logic Network (Richardson and Domingos 2006)

$$0.7 \quad \forall x \forall y \forall z\, \mathtt{Friends}(x, y) \land \mathtt{Friends}(y, z) \Rightarrow \mathtt{Friends}(x, z)$$

$$2.3 \quad \forall x\, \neg\exists y\, \mathtt{Friends}(x, y) \Rightarrow \mathtt{Smokes}(x)$$

$$1.5 \quad \forall x\, \mathtt{Smokes}(x) \Rightarrow \mathtt{Cancer}(x)$$

$$1.1 \quad \forall x \forall y\, \mathtt{Friends}(x, y) \Rightarrow (\mathtt{Smokes}(x) \Leftrightarrow \mathtt{Smokes}(y))$$

Probabilistic Relational Models

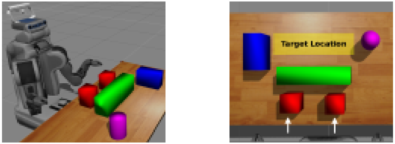
ProbLog (De Raedt, Kimmig and Toivonen 2007)

$$1.0 :: \texttt{likes}(X, Y) \texttt{:-} \texttt{friendOf}(X, Y).$$
$$0.8 :: \texttt{likes}(X, Y) \texttt{:-} \texttt{friendOf}(X, Z), \texttt{likes}(Z, Y).$$
$$0.5 :: \texttt{friendOf}(\mathit{john}, \mathit{mary}).$$
$$0.5 :: \texttt{friendOf}(\mathit{mary}, \mathit{pedro}).$$
$$0.5 :: \texttt{friendOf}(\mathit{mary}, \mathit{tom}).$$
$$0.5 :: \texttt{friendOf}(\mathit{pedro}, \mathit{tom}).$$

Probabilistic Relational Models

- What do these models have in common?
- When performing inference...
  - do we have to consider every detail?
  - what makes inference challenging?
  - can we do any better?
- How can we learn PRMs from data?

Applications



Moldovan and De Raedt 2014

Main Results

Definition (Equivalence)

Two n-tuples of constants a and b are equivalent if

$$(\mathtt{P} \circ \rho)(a) = (\mathtt{P} \circ \rho)(b)$$

for all atoms $\mathtt{P} \circ \rho$ acting on n variables.

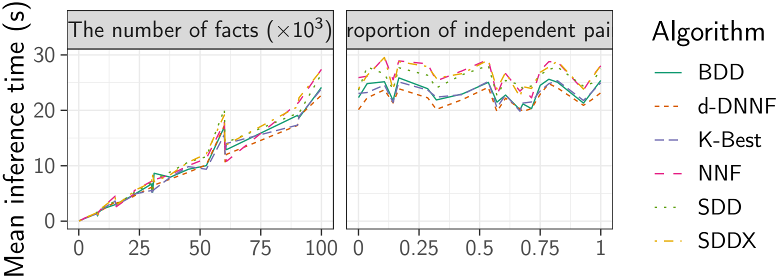
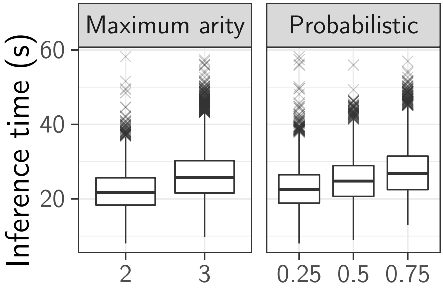
How Program Features Influence Inference Time



How Program Features Influence Inference Time



Outline

Defining WMC

Definition

Let $\mathbf{B}$ be an atomic Boolean algebra. Let $L \subset \mathbf{B}$ be such that every atom m can be uniquely expressed as $m = \bigwedge L'$ for some $L' \subseteq L$, and let $w \colon L \to \mathbb{R}_{\geq 0}$ be arbitrary. The weighted model count $\mathrm{WMC}_w \colon \mathbf{B} \to \mathbb{R}_{\geq 0}$ is defined as

$$\mathrm{WMC}_w(x) = \begin{cases} 0 & \text{if } x = 0 \\ \prod_{l \in L'} w(l) & \text{if } x = \bigwedge L' \text{ is an atom} \\ \sum_{\text{atoms } a \leq x} \mathrm{WMC}_w(a) & \text{otherwise} \end{cases}$$

for any $x \in \mathbf{B}$.

WMC Requires Independent Literals

Theorem

Let $\mathbf{B}$ *be a free Boolean algebra over* $\{l_i\}_{i=1}^n$ *with measure*

$$m\colon \mathbf{B} \to \mathbb{R}_{\geq 0},$$

and let

$$L = \{l_i\}_{i=1}^n \cup \{\neg l_i\}_{i=1}^n.$$

Then there exists a weight function $w\colon L \to \mathbb{R}_{\geq 0}$ *such that* $m = \mathrm{WMC}_w$ *if and only if*

$$m(l \wedge l') = m(l)m(l')$$

for all distinct $l, l' \in L$ *such that* $l \neq \neg l'$.

Extending the Algebra

$$
\begin{tikzcd}
\mathbb{R}_{\geq 0} & & \\
\mathbf{B} \arrow[u, "m"] \arrow[r, hook, "\iota"] & \mathbf{B}' \arrow[ul, "m'"'] & \\
L \arrow[u, hook] \arrow[r, hook] & L' \arrow[u, hook] \arrow[r, "w"] & \mathbb{R}_{\geq 0}
\end{tikzcd}
$$

How Can This Benefit Inference?

Theorem (Sikorski 1969)

If $\mathbf{B} = \mathcal{F}\{a\} + \mathcal{F}\{b\}$, *then* $\Pr(a \wedge b) = \Pr(a)\Pr(b)$.

How Can This Benefit Inference?

Theorem (Sikorski 1969)

If $\mathbf{B} = \mathcal{F}\{a\} + \mathcal{F}\{b\}$, *then* $\Pr(a \land b) = \Pr(a)\Pr(b)$.

Conjecture

If $\mathbf{B} = \mathcal{F}\{a\} +_{\mathcal{F}\{c\}} \mathcal{F}\{b\}$, *then* $\Pr(a \land b \land c) = \Pr(a \land c)\Pr(b \land c)$.

How Can This Benefit Inference?

Theorem (Sikorski 1969)

If $\mathbf{B} = \mathcal{F}\{a\} + \mathcal{F}\{b\}$, *then* $\Pr(a \wedge b) = \Pr(a)\Pr(b)$.

Conjecture

If $\mathbf{B} = \mathcal{F}\{a\} +_{\mathcal{F}\{c\}} \mathcal{F}\{b\}$, *then* $\Pr(a \wedge b \wedge c) = \Pr(a \wedge c)\Pr(b \wedge c)$.

Conjecture

Using coproducts and pushouts, one can encode a Bayesian network into WMC with fewer literals and a shorter theory than before.

How Can This Benefit Inference?

Theorem (Sikorski 1969)

If $\mathbf{B} = \mathcal{F}\{a\} + \mathcal{F}\{b\}$*, then* $\Pr(a \wedge b) = \Pr(a)\Pr(b)$*.*

Conjecture

If $\mathbf{B} = \mathcal{F}\{a\} +_{\mathcal{F}\{c\}} \mathcal{F}\{b\}$*, then* $\Pr(a \wedge b \wedge c) = \Pr(a \wedge c)\Pr(b \wedge c)$*.*

Conjecture

Using coproducts and pushouts, one can encode a Bayesian network into WMC with fewer literals and a shorter theory than before.

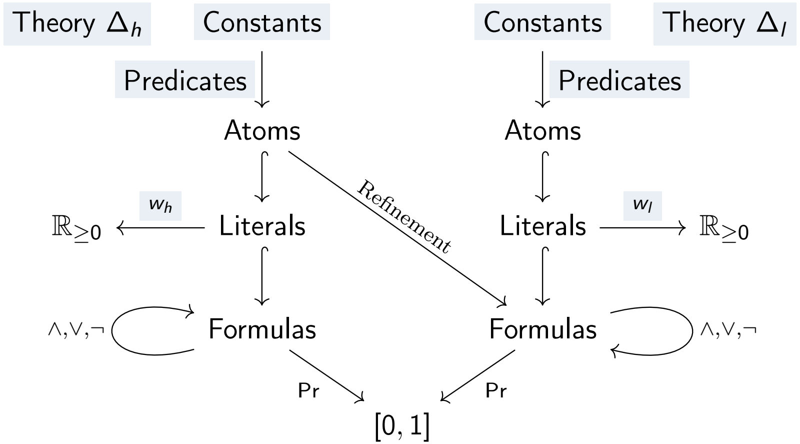
Conjecture

A #SAT algorithm can be adapted without sacrificing efficiency.

Outline

"I'm a fiction writer in the grant-proposal genre."

Abstraction: Before



Abstraction: After

$$\begin{tikzcd}
S_h \arrow[d, hook] \arrow[dr] & S_l \arrow[d, hook] \\
\mathbf{B}_h \arrow[r, dashed] \arrow[d] & \mathbf{B}_l \arrow[d] \\
\mathbf{B}_h/(\neg\Delta_h) \arrow[r, dashed] & \mathbf{B}_l/(\neg\Delta_l)
\end{tikzcd}$$

Plan for the Future

1. Rework the equivalence paper (2 months)
2. Improve and resubmit the random programs paper (done)
3. WMC 2.0
   - Design a new encoding for Bayesian networks (2 months)
   - Experimentally compare with other encodings (2 months)
4. Abstractions as homomorphisms
   - Find algebraic counterparts for logic-based concepts (1 month)
   - Establish 'iff' results for their preservation (2 months)
   - Develop algorithms for constructing abstractions (2 months)
   - Theorems for the preservation of independence (3 months)
5. And lost of writing, editing, and rewriting ($[9, \infty)$ months)
